

Aung Min Ko

Junior Web Developer

I aim to transition my career into web development as a Junior Web Developer, using my skills in PHP, Laravel, Node.js, MySQL, and PostgreSQL, along with the problem-solving and communication abilities I developed through my sales experience.

Work Experience

CodeLab

On Job Training
Aug 2025 - Oct 2025

Developed a full-featured web application that includes a product catalog, shopping cart and checkout system, user authentication with profile management, and an admin dashboard for order management. Managed the database schema and implemented server-side logic using MySQL.

Euro Car Showroom

Sale Executive
2020 - 2023

Explained car features, models, and pricing to customers, ensuring clear and accurate information. Responded to customer inquiries and provided reliable assistance throughout the sales process. Followed up with potential buyers after showroom visits to maintain engagement and build relationships. Consistently met monthly sales targets and performance goals.

Projects

E-Commerce System

Built a full-featured online shopping platform using the Laravel framework, where customers can browse products, add items to a cart, and complete checkout. For administrators, the system supports management of users, products, categories, orders, delivery methods and vouchers. The architecture incorporates user authentication & authorization, validation, shipping logic and a responsive UI.

Utility Management System

Developed a web-application API using Laravel to manage utility contracts, meter readings, and tenant issues for properties. Covered features include role-based access control (Admin, Staff, Tenant), tracking of meter usage (electricity, water, room, general), user and contract management, and issue-reporting workflows. Built with modern PHP, RESTful endpoints and PostgreSQL backend.

Yoga Classes Management API

Created a backend API for a yoga-studio application using Laravel 10, handling roles (Admin, Trainer, Student), lesson management, subscriptions, trainer appointment bookings, testimonials, and relational data models. Focused on clean API design, database relationships (many-to-many via pivot tables) and scalable server-side logic.
